1 Introduction

1.1 Motivation

“Background” here.

this is citation recommendation and this is why it is relevant

several disciplines have a history of analysing citations[1]

there's peripheral fields like citation context analysis[2], using citations for document exploration[3], citation function[4, 5, 6, 7], citation based plagiarizm detection[8]

it's different from paper recommendation in its intention (paprec→toread, citrec→tocite)

also there's different approaches to it (collab.fil. / input=paper / input=sentence / input=sentence+one citation[9] / input=abstract[10])

(the whole thing is being actively studied[11] <- check if paprec or citrec)

1.2 Problem setting

explicit semantic representations frequently seen in IR but no large body of work applying them for citation recommendation

therefore investigate how they can be applied to citation recommendation

1.3 Method

generate a data set fit for investigation of citation recommendation employing named entities and claims

devise citation recommendation approach implement and evaluate

1.4 Document structure

foo bar

1.5 Example Section

Copypasta of useful stuff below.

- Put a tilde (nbsp) in front of citations [4].
- **(TODO: Do this!)**
- **(EXTEND: Write more when new results are out!)**
- **(DRAFT: Hacky text!)**
- Chapter 1
- the colors of the Uni
 - UniBlue
 - UniRed
 - UniGrey
- a command for naming matrices \mathbf{G} , and naming vectors \mathbf{a} . This overwrites the default behavior of having an arrow over vectors, sticking to the naming conventions normal font for scalars, bold-lowercase for vectors, and bold-uppercase for matrices.

- named equations:

$$d(a, b) = d(b, a) \tag{1}$$

symmetry

- Use “these” for citing, not "these"
- If an equation is at the end of a sentence, add a full stop. If it’s not the end, add a comma: $a = b + c$ (1),
- <https://en.wikipedia.org>
- Do not overuse footnotes¹ if possible.

¹<https://en.wikipedia.org>

2 Related Work

lots. pick wisely.

Leveraging Semantic Annotations to Link Wikipedia and News Archives[12]

Using NEL + dependency trees for music recommendation[13]

3 Background

explain all the things.

Figure 1: Caption that appears under the fig—do I want this in bold tho?

Algorithm 1 Stochastic Gradient Descent: Neural Network

Create a mini batch of m samples $\mathbf{x}_0 \dots \mathbf{x}_{m-1}$

foreach sample \mathbf{x} **do**

$\mathbf{a}^{\mathbf{x},0} \leftarrow \mathbf{x}$

▷ Set input activation

foreach Layer $l \in \{1 \dots L-1\}$ **do**

▷ Forward pass

$\mathbf{z}^{\mathbf{x},l} \leftarrow \mathbf{W}^l \mathbf{a}^{\mathbf{x},l-1} + \mathbf{b}^l$

$\mathbf{a}^{\mathbf{x},l} \leftarrow \varphi(\mathbf{z}^{\mathbf{x},l})$

end for

$\delta^{\mathbf{x},L} \leftarrow \nabla_{\mathbf{a}} C_{\mathbf{x}} \odot \varphi'(\mathbf{z}^{\mathbf{x},L})$

▷ Compute error

foreach Layer $l \in L-1, L-2 \dots 2$ **do**

▷ Backpropagate error

$\delta^{\mathbf{x},l} \leftarrow ((\mathbf{W}^{l+1})^T \delta^{\mathbf{x},l+1}) \odot \varphi'(\mathbf{z}^{\mathbf{x},l})$

end for

end for

foreach $l \in L, L-1 \dots 2$ **do**

▷ Gradient descent

$\mathbf{W}^l \leftarrow \mathbf{W}^l - \frac{\eta}{m} \sum_{\mathbf{x}} \delta^{\mathbf{x},l} (\mathbf{a}^{\mathbf{x},l-1})^T$

$\mathbf{b}^l \leftarrow \mathbf{b}^l - \frac{\eta}{m} \sum_{\mathbf{x}} \delta^{\mathbf{x},l}$

end for

4 Data set

approach approach.

4.1 Existing data sets

and why a new one was necessary

MAG[14] (use/analysis: [15, 16, 17])

use of PMC OAS[18, 19, 20, 21] (PMC OAS problems: [18])

4.2 Data set creation

foo

survey paper on extraction of meta data (author, year, ...) and classification of sentences
(method, goal, ...) from publications[22]

evaluation of reference string parsers[23], a dataset for reference string parsing[24]

4.3 Data set evaluation

bar

5 Semantic approaches to citation recommendation

types of citations (naming an entity, backing up a claim, etc.)

how citations are embedded in sentences (integral/non-integral[25, 26, 27, 28, 29])

5.1 Fields of Study as names entities

name name

5.2 Claims

5.2.1 Tools for extracting claims

tools tools

also: Survey on open information extraction[30]

context specific claim detection[31]

if only papers where semantically annotated as proposed in [32]

5.2.2 A model of aboutness closely tied to claim structure

unfeasibility of use of PredPatt output as is

resulting compromise model

predpatt[33, 34]

alternative view: model gives a very selective citation context derived from claim structure

(cf. concept of reference scope as sub part of citation context sentence[35, 36])

6 Evaluation

evaluate evaluate

implemetation pain and bad evaluation scores[37]

6.1 Special considerations for citation recommendation

train/test splitting (per cited doc, temporal, ...), re-recommendation, number of contexts describing a recommendation item, ...

a cited doc's role (how it is cited) can develop over time[38, 39]

relevance of time[40]

candidates are only citations within current paper[41]

6.2 Offline evaluation

pre-filtering experiments (knn[21], lsi, lda, fos, ...)

different evaluation settings (all, COnly, comparison to MAG, ...)

FoS alone, restrictively combined w/ BOW, only directly preceeding, ...

PP model alone, combined, ...

6.3 Online evaluation

7 Conclusion

conclude conclude.

8 Future work

As a first step identify types of citations more systematically.

For different types, different models.

Proper claim model. (that could also include assessing credibility[42])

Argumentative structures. (Argumentation mining[43, 44, 45])
